

Environmental Issues

Environmental problems have become exceptionally acute in the modern world and environmental protection has become a vital necessity for all people. Being aware of the inevitable danger people are now more concerned about the environment. One of the most serious ecological problems is pollution in its many forms: water pollution, air pollution, noise pollution and nuclear pollution.

One of the most essential cutting-edge problems is the shortage of clean water. Some plants still pour poisonous wastes into streams and rivers. Chemicals used by farmers to protect crops from pests and weeds may get into rivers. Moreover, some cities pour sewage straight into rivers with no treatment beforehand. Nowadays people should save this precious resource not only for themselves but also for the sake of the next generation.

As the population of large cities continues to grow, pollution problems become worse. Air becomes contaminated as a result of our own activities. The number of cars is growing so the concentration of harmful substances in big cities is over admissible level. Every year the world's industries pollute the atmosphere with a great amount of dust and other substances. Some factories release harmful substances to remove wastes from plants.

Pollution from cars and plants poisons the air we breathe and cause the greenhouse effect and acid rains. Another alarming environmental problem is depletion of the ozone layer, which protects the Earth from dangerous rays of the sun. They get through the atmosphere because of the ozone holes causing lung cancer and other diseases.

Although noise is not a chemical, it is a kind of pollution. Noise is all around us and we do not notice it. People who are exposed to loud noise all the time suffer from nervous breakdowns. They become stressed out, often lose their temper and even have unpredictable behavior.

One can't help mentioning such a burning issue as nuclear pollution. Safety of nuclear power stations is of great importance. People all over the world protest against nuclear tests and weapons.

To sum up, there are lots of issues such as destruction of wildlife, overpopulation and shortage of natural resources which are worth being taken into account. In pursuit of new discoveries, inventions and profits people forget about nature. They are gradually approaching the edge of ecological catastrophe. People should change their attitude towards the environment.
